Notes:

1. The exam is closed books/closed notes - except for one page of notes.
2. Please show ALL work. Incorrect answers with no supporting explanations or work will be given no partial credit.
3. Please indicate clearly your answer to the problem.

Problem No. 1: For the linear time-invariant system: $H(s) = \frac{s+2}{(s^2-2s-3)}$

(a) Find the state variable description of the system.

using partial fractions:

$$H(s) = \frac{(s+2)}{s^2-2s-3} = \frac{(s+2)}{(s+1)(s-3)} = \frac{A}{s+1} + \frac{B}{s-3}$$

$$A = \left. \frac{(s+2)}{s-3} \right|_{s=-s-1} = \frac{(-s-1+s+2)}{-s-1+s-3} = \frac{1}{-4}$$

$$B = \left. \frac{(s+2)}{s-3} \right|_{s=-s+3} = \frac{(-s+3+s+2)}{-s+3+8+1} = \frac{5}{4}$$

$$H(s) = \frac{Y(s)}{X(s)} = -\frac{25}{s+1} + \frac{1.25}{s-3} = -25X1(s) + 1.25X2(s)$$

As a result:

$$X1(s) = \frac{1}{s+1}, -X1 + u \quad X2(s) = \frac{1}{s-3}, 3X2 + u$$

$$\dot{x}_1 = -X1 + u, \dot{x}_2 = 3X2 + u, y = 0.25X1 + 3.75X2 + 2u$$

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} X1 \\ X2 \end{bmatrix} + \begin{bmatrix} 1 \\ 1 \end{bmatrix} (u) \quad y = \begin{bmatrix} 0.25 & 3.75 \end{bmatrix} \begin{bmatrix} X1 \\ X2 \end{bmatrix} + 2u$$

$$A = \begin{bmatrix} 0 & -1 \\ 0 & 3 \end{bmatrix}$$

b) Compute the state transition matrix, $\Phi(t)$.

The matrix is derived as follows:

$$\Phi(s) = (sI - A)^{-1} = \begin{bmatrix} s+1 & 0 \\ 0 & s-3 \end{bmatrix}^{-1} = \frac{1}{s^2 - 2s - 3} \begin{bmatrix} s+1 & 0 \\ 0 & s-3 \end{bmatrix} = \begin{bmatrix} \frac{1}{s-3} & 0 \\ 0 & \frac{1}{s+1} \end{bmatrix}$$

$$\Phi(t) = \begin{bmatrix} e^{-3t} & 0 \\ 0 & e^{-t} \end{bmatrix}$$

(c) Using the state variable representation, implement this as an RLC circuit.

Due to the instabilities in the system, an RLC circuit cannot be derived.

Problem No. 2: This problem deals with various aspects of Z-Transforms.

(a) **Derive** the expression for the Z-Transform of $x(n) = na^{-n}u(n)$.

$$x(n) = na^{-n}u(n)$$

$$Z[na^{-n}u(n)] = \frac{1}{e^{-at}z^{-1}} = \frac{1}{1 - Kz^{-1}}$$

$$(x(nT) = e^{-at}), a > 0, n \geq 0$$

$$X(z) = \sum_{n=0}^{\infty} e^{-ant}z^{-n} = \sum_{n=0}^{\infty} (e^{-at}z^{-1})^n$$

$$(x = e^{-at}z^{-1}), X(z) = \frac{1}{1 - e^{-at}z^{-1}}, |z| > e^{-at}K = e^{-at}$$

$$X(z) = \mathfrak{Z}[K^n] = \frac{1}{1 - Kz^{-1}}, |z| > K$$

$$\frac{1}{1 - Kz^{-1}} = \frac{z}{z - K}$$

X(z) has a zero at z=0.

X(z) has a pole at z=K.

(b) For the transfer function, $H(z) = \frac{1 - (1/2)z^{-1}}{1 - (3/2)z^{-1} - z^{-2}}$, find a closed-form expression for $h(n)$ (don't use long division).

$$\frac{H(z)}{z} = \frac{z^2 - 0.5z}{z^2 - 1.5z + z^2}$$

$$\frac{H(z)}{z} = \frac{z^2 - 0.5z}{-1 - 1.5z + z^2}$$

$$\frac{H(z)}{z} = \frac{z^2 - 0.5z}{(z-1)(z-0.5)} = \frac{A}{(z-1)} + \frac{B}{(z-0.5)}$$

$$A = \frac{z^2 - 0.5z}{(z - 0.5)}$$

$$A = -0.2$$

$$B = \frac{z^2 - 0.5z}{(z - 0.5)}$$

$$B = 1.2$$

$$\frac{H(z)}{z} = \frac{-0.2}{(z - 0.5)} + \frac{1.2}{(z - 1)}$$

$$H(z) = \frac{-0.2z}{(z - 0.5)} + \frac{1.2z}{(z - 1)}$$

$$H(z) = \frac{-0.2}{12z^{-1}} + \frac{1.2}{10.5z^{-1}}$$

$$X(n) = 1.2(2)^n - 0.25(-)^n, n \geq 0$$

(c) Is the system stable?

No

(d) Is the system causal? Explain.

Yes. the system starts at 0 time.

Problem No. 3: For the system shown:

(a) Plot the spectrum of $g(n)$:

(b) Plot the spectrum of $y(n)$:

(c) How do you explain the fact that the sample frequency of $y(n)$ is less than the Nyquist rate, yet there is no distortion?

! Dropping those samples would cause the Nyquist rate would be $2f_s$.
